Volvo ID service migration

Oct 26, 2026 | 2 min read

Breaking changes! We are migrating OAuth 2.0 services!

Maintenance Migration

Volvo ID is migrating from one IAM service to another, and this unfortunately brings some breaking changes.

The existing OAuth 2.0 client you are using today will *no longer work* after **31 January 2027**.

Who this is for

Volvo Cars Developer Portal users who currently have an OAuth 2.0 client beginning with `dc-`.

What "done" means

A client is considered migrated when:

- You have published a new client and received a client ID starting with `vid-dc-`
- Your application is updated to use the new client and associated URLs, and works for the relevant flows (authorization code, refresh token, etc.), as well as the new VCC API key.
- The old client with client ID starting with `dc-` is deleted.

When

- Deadline: 31 January, 2027

Changes to expect

New client IDs

- You will get new client IDs and secrets.
  - This means users will have to login again.
  - Client ID has a `vid-dc-` prefix.

Claims changes

- `address`
  - `city` → `locality`
  - `countryCode` → `country`

- `firstname` → `given_name`
- `language` → `locale`
- `lastname` → `family_name`
- `name` (first+last, added)
- ~~`pi.sri`~~ (removed)
- `username` → `preferred_username`
- `client_id` → `azp`

Migration workflow (what you need to do)

Start with creating a new client and test it out.

1. Go to your account page and Create new application. Give it a good name.
2. Update your application to use the new service, including PKCE for the authorisation code flow (send `code_challenge` and `code_challenge_method`, then `code_verifier` when exchanging the code).
    - Change issuer URL from the old service to the new. See Discovery Endpoints below.
    - Update client ID and secret
    - Update VCC API Key
3. Verify end-to-end behavior Verify the flows that your application uses:

- authorization code flow
- refresh token (if used)

Confirm that APIs can consume your tokens.

1. Delete the old application
